

ABSTRACT OF THE DISCLOSURE

5 An oil or gas well slip system is provided that includes  
a first movable member having an interactive contact surface  
and a second movable member having a mating interactive  
contact surface for slidable engagement with the interactive  
contact surface of the first movable member. The first and  
10 second movable members are each comprised of a first material.  
A second material, compositionally different from the first  
material, is attached to the interactive contact surface of  
either the first or the second movable member.
